

ABSTRACT OF THE DISCLOSURE

1
2 A milling cutter, comprising a cutter body, a cutter holder secured on
3 the cutter body, a cutting insert secured on the cutter holder, and a locking
4 screw extended through the cutter holder and the cutting insert to combine the
5 cutter holder and the cutting insert. Thus, when the locking screw is screwed
6 on the cutter holder, the elastic clamp of the cutter holder is urged to move
7 toward the fixing seat, so that the clamping jaw of the elastic clamp is closely
8 urged on the first end of the cutting insert and the clamping face of the elastic
9 clamp is closely urged on a second end of the cutting insert, thereby locking the
10 cutting insert on the cutter holder rigidly and stably.
